J. Biol. Chem. 275:19139-19145(2000).

-i- FUNCTION: MAY PLAY A ROLE IN THE PROCESSES OF LYMPHOCYTE HOMING SECONDARY LYMPHOID ORGANS.

-i- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN (POTENTIAL).

-i- TISSUE SPECIFICITY: PROMINENTLY EXPRESSED ON HIGH ENDOTHELIAL VENULES BUT IS ALSO PRESENT ON THE ENDOTHELIA OF OTHER VESSELS.

LOCALIZED TO THE INTERCELLULAR BOUNDARIES OF HIGH ENDOTHELIAL
                                                                                                                                                                                                                                             CHAIN

                                     DOMAIN CONTAINING ISOFORMS (CRD-NRG) PROBABLY REGULATE THE EXPRESSION OF NICOTINIC ACETYLCHOLINE RECEPTORS AT DEVELOPING INTERNEURONAL SYNAPSES. THE IG-NRG ISOFORM IS REQUIRED FOR THE INTIAL INDUCTION AND/OR MAINTENANCE OF THE MATURE LEVELS OF ACETYLCHOLINE RECEPTORS AT NEUROMUSCULAR SYNAPSES.

-IS SUBCELLULAR LOCATION: EXISTS AS A TYPE I MEMBRANE PROTEIN AND AS A PROTECLYTICALLY RELEASED SOLUBLE GROWTH FACTOR FORM. THE MEMBRANE-BOUND FORM DOES NOT SEEM TO BE ACTIVE (BY SIMILARITY).

-I- ALTERNATIVE PRODUCTS: AT LEAST 4 ISOFORMS; ARIA/IG-NRG (SHOWN HERE), CRD-NRG-BETALA, CRD-NRG-BETALA AND CRD-NRG-BETALA, REPRODUCED BY ALTERNATIVE SPLICING. ARIA CONTAINS AN IG-LIKE DOMAIN WEDEREAS IN THE CRD-NRG (OR NARIA) ISOFORMS; THE EGF-LIKE DOMAIN IS REPLACED BY A CYSTELMS-RICH DOMAIN (CRD).

-I- DEVELOPMENTAL STAGE: CRD-NRG ISOFORM IS DETECTED AT EMBRYONIC DAY 4 (ED4) IN BOTH VISCERAL AND SOMATIC MOTOR NEURONS OF SPINAL CORD AND IS HIGHEST AT ED5. IG-NRG ISOFORM IS NOT EXPRESSED UNTIL ED 6 IN SPINAL CORD. AT ED 11 BOTH ISOFORMS DISPLAY COMPARABLE LEVELS.

-I- DOMAIN: THE CYTOPLASMIC DOMAIN MAY BE INVOLVED IN THE REGULATION OF THE PROTEOLYTIC PROCESSING INVOLVES INITIAL INTRACELLULAR DOMAIN DIMERIZATION (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CHICK
                                                                                                                                                                                                                                                                                                                                                                                     Yang X., Kuo Y., Devay P., Yu C., Role L.;

C -!- FUNCTION: PROBABLE ROLE IN MYOFILAMENT ASSEMBLY AND/OR ATTAC
C -!- FUNCTION: PROBABLE ROLE IN ERCEPTORS IN MUSCLE.

OF THE MYOFILAMENT LATTICE TO THE CELL MEMBRANE. UNC-52 MAY
EXTRACELLULAR ANCHOR FOR INTEGRIN RECEPTORS IN MUSCLE.

C -!- SUMCELLULAR LOCATION: EXTRACELLULAR MATRIX.

C -!- SUMCELLULAR LOCATION: EXTRACELLULAR MATRIX.

C -!- TISSUE SPECIFICITY: FOUND IN THE BASEMENT MEMBRANE OF ALL
CONTRACTILE TISSUES. IT IS CONCENTRATED OVER MUSCLE DENSE BOOM AND M-LINES WHICH ARE ASSOCIATED WITH BETA-INTEGRIN.

C -!- DEVELOPMENTAL STAGE: SYNTHESIZED EARLY IN EMBRAOGENESIS.

-!- SIMILARITY: CONTAINS 3 LDL-RECEPTOR CLASS A DOMAINS.

C -!- SIMILARITY: CONTAINS 7 LAMININ EGF-LIKE DOMAINS.

C -!- SIMILARITY: CONTAINS 2 LAMININ DOMAINS IV.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: ENDOTHELLAL CELLS.
TISSUE SPECIFICITY: ENDOTHEL IMMUNOGLOBULIN SUPERFAMILY. CONTAINS SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. CONTAINS 2 C2-LIKE AND ONE V-LIKE DOMAINS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protein search, using sw model
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                BLOSUM62

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and (13) treating a subject with a condition associated with an interaction of an RAGE with a receptor for RAGE on a cell. The methods can be used for treating conditions associated with an interaction of an ABP or an RAGE with a receptor for RAGE, e.g. diabetes, Alzheimer's disease, sentlity, renal failure, hyperlipidaemic atherosclerosis, neuronal cytotoxicity, Down's syndrome, dementia associated with head trauma, amyotrophic lateral sclerosis, multiple sclerosis, amyloidosis, an autoimmune disease, inflammation, a tumour, cancer, male impotence, wound healing, periodontal disease, neuropathy, retinopathy, nephropathy or neuronal degeneration.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
The present sequence represents an immunologically active fragment of a soluble human receptor to an advanced glycosylation end product (RAGE) polypeptide. The present invention describes
                                                                                         Anti-advanced glycosylation end product polypeptide antibody prevents receptor binding and therefore reduces vascular permeability, useful to treat diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        when considering tumour invasion. In normal developing neurons RAGE colocalizes with amphoterin which is a matrix associated polypeptide. The expression of both RAGE and amphoterin decreases after birth, but both have increased expression in tumours. RAGE polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the amino acid sequence of a fragment of the human soluble Receptor for Advanced Glycation Endproducts (RAGE). RAGE interacts was a range of physiologically and pathophysiologically relevant ligands
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  amount of the pharmaceutical composition containing a RAGE polypeptide. The invention also relates to a method for evaluating the ability of an agent to inhibit tumour invasion in a local cellular environment. RAGE can be administered to a patient in a pharmaceutically acceptable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAY52132-Y52135 are used in the invention in a method for inhibiting tumour invasion and metastasis. The method involves inhibiting tumour invasion and metastasis via administration of a therapeutically effective

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, occlusive vascular disorders, neuropathy, nephropathy, retinopathy, haemodialysis associated amyloidosis or atherosclerosis. The Ab can also be used for
                                                                                                                                                                                This is a peptide fragment of a human advanced glycosylation end-product receptor (RAGE) polypeptide. The RAGE polypeptides and its active fragments or their mimetics can inhibit interaction between advanced glycosylation end-products (AGE) and a receptor (specifically RAGE). They are used to treat diseases associated with AGE/RAGE interaction, such as increased vascular permeability, diabetes mellitus (particularly compilications such as micro- or macro- vasculopathy or occlusive vascular
                 disorders such as neuropathy, nephropathy, atherosclerosis or retinopathy) or haemodialysis-associated amyloidosis, also activation of microglial cells by beta-amyloid peptides in Alzheimer's disease or age-related disorders such as oxidative stress. These RACE polypeptides are also used, when immobilised, to purify AGE from a protein mixture are some for compounds that are agonists and antagonists of AGE/RAGE
                                                                                                                                                                                                                                                                                                                                                                                                                               Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New soluble advanced glycosylation end-product receptor polypeptide - used for reducing vascular permeability, complications of diabetes etc., also for purification and to screen for modulators

                                                          of a soluble human receptor to an advanced glycosylation end product (RAGE) polypeptide. The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, occlusive vasculated amyloidosis or atheroselerosis. The Ab can also be used for the contraction and the contraction between the contraction between the contraction of the contraction between the contraction of the contraction between the contraction between the contraction between the contraction of the contraction between the contrac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 levels of AGE. Antibodies against RAGE polypeptides are useful as immunoassay reagents for measurement of RAGE levels, and as inhibitors of interaction between AGE and RAGE or other receptors and for purification and quantification of RAGE polypeptides. The encoding nucleic acids are used to express recombinant RAGE and as probes for isolating related
                                                                                                                                                                                                                                                                                                                                                                                                                   Anti-advanced glycosylation end product polypeptide antibody prevents receptor binding and therefore reduces vascular permeability, useful to treat diabetes mellitus

                                                                                                                                                                                                                                                                                                                      This is a peptide fragment of a human advanced glycosylation end-product receptor (RAGE) polypeptide. The RAGE polypeptides and its active fragments or their mimetics can inhibit interaction between advanced glycosylation end-products (AGE) and a receptor (specifically RAGE). They are used to treat diseases associated with AGE/RAGE interaction, such as increased vascular permeability, diabetes mellitus (particularly complications such as micro-or macro-vasculopathy or occlusive vascular complications such as neuropathy, nephropathy, atherosclerosis or retinopathy) or haemodialysis-associated amyloidosis, also activation of microglial cells by beta-amyloid peptides in Alzheimer's disease or age-related disorders such as oxidative stress. These RAGE polypeptides are also used, when immobilised, to purify AGE from a protein mixture and to screen for compounds that are agonists and antagonists of AGE/RAGE interaction. They can also be used diagnostically to detect abnormal levels of AGE. Antibodies against RAGE polypeptides are useful as immunoassay reagents for measurement of RAGE levels, and as inhibitors of interaction. They can also be used from the receivers and sinhibitors of interaction and antagonists and antagonists of AGE/RAGE interaction. They can also be used from the receivers and as inhibitors of interaction between AGE and BAGE or other receivers and for missingly the activity of the protein mixture and antipolic protein and antipolic protein as in the protein and antipolic protein mixture and a multipolic protein and antipolic protein mixture and any protein mixture and a protein mixture a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT
                                                                                                                                                                                                   CC (ABP) interaction with a receptor for RAGE when the receptor is on the control of a cell; (2) inhibiting degeneration of a neuronal cell; (3) CC inhibiting formation of an ABP fibril on a cell; (4) inhibiting CC extracellular assembly of an ABP fibril on a cell; (6) inhibiting CC aggregation of ABP on the surface of a cell; (6) inhibiting infiltration CC of a microglial cell into senile plaques; (7) inhibiting activation of a CC microglial cell by an ABP; (8) treating a subject with a condition CC associated with an interaction of an ABP with a receptor for RAGE on a CC cell; (9) evaluating the ability of an agent to inhibit binding of an CC ABP with a v-domain of a receptor for RAGE on the surface of a cell; (10) CC inhibiting activation of an SW kappas gene in a cell; (11) inhibiting CC inhibiting activation of an CK kappas gene in a cell; (11) inhibiting CC inhibiting activation of a subject; (12) inhibiting an RAGE's interaction CC with a receptor for RAGE when the receptor is on the surface of a cell; CC and (13) treating a subject with a condition associated with an interaction of an RAGE with a receptor for RAGE on a cell. The methods CC can be used for treating conditions associated with an interaction of an CC ABP or an RAGE with a receptor for RAGE on a cell. Schalmer's conditions associated with an interaction of an CC ABP or an RAGE with a receptor for RAGE, e.g. diabetes, Alzhelmer's conditions associated with an interaction of an CC ABP or an RAGE with a receptor for RAGE, e.g. diabetes, Alzhelmer's conditions associated with a condition condition condition conditions associated with a condition condit
                                                                                                                             disease, senility, renal failure, hyperlipidaemic atherosclerosis, neuronal cytotoxicity, Down's syndrome, dementia associated with head trauma, amyotrophic lateral sclerosis, multiple sclerosis, amyloidosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            amino acid sequence corresponding to an amino acid sequence of a V-domain of a receptor for an advanced glycation end product (RAGE). V-domain of a receptor for an advanced glycation end product (RAGE). Also described are methods for: (1) inhibiting an amyloid-beta peptide (ARA) interaction with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       neuronal cytotoxicity; head trauma; amyotrophic lateral sclerosis; multiple sclerosis; amyloidosis; autoimmune disease; inflammation; tumour; cancer; male impotence; wound healing; periodontal disease; neuropathy; retinopathy; nephropathy; neuronal degeneration.
                                                                                                       an autoimmune disease, inflammation, a tumour, cancer, male impotence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes novel isolated peptides (I)

                                                                                                                                                                                                                                                                                                                                        This is the amino acid sequence of a fragment of the human soluble Receptor for Advanced Glycation Endproducts (RAGE). RACE interacts with a range of physiologically and pathophysiologically relevant ligands when considering tumour invasion. In normal developing neurons RAGE colocalizes with amphoterin which is a matrix associated polypeptide. The expression of both RAGE and amphoterin decreases after birth, but both have increased expression in tumours. RAGE polypeptides AAY52132-Y52135 are used in the invention in a method for inhibiting tumour invasion and metastasis. The method involves inhibiting tumour invasion and metastasis via administration of a therapeutically effective amount of the pharmaceutical composition containing a RAGE polypeptide. The invention also relates to a method for evaluating the ability of an agent to inhibit tumour invasion in a local cellular environment. RAGE can be administered to a patient in a pharmaceutically acceptable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 29; Page 62; 88pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Soluble receptor for advanced glycation endproducts; RAGE; invasion; metastasis; amphoterin; neuron; inhibit; therapy
                                                                                                                                                                                                                                                                  Sequence

                                                                                                                                                                                                                                                                                                      glycosylation end product (RAGE) polypeptide. The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (AAE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, occlusive vascular disorders, neuropathy, nephropathy, retinopathy, haemodialysis associated amyloidosis or atherosclerosis. The Ab can also be used for the isolation and purification of human RAGE polypeptide.
Human RAGE polypeptide (318 amino acid residues).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti-advanced glycosylation end product polypeptide antibody prevents receptor binding and therefore reduces vascular permeability, useful to treat diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human mature receptor to an advanced glycosylation end product.
                             08-MAY-1998

These RAGE polypeptides are also used, when immobilised, to purify AGE from a protein mixture and to screen for compounds that are agonists and antagonists of AGE/RAGE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is a human advanced glycosylation end-product receptor (RAGE) polypeptide (318 amino acid residues). The RAGE polypeptides and its active fragments or their mimetics, inhibit interaction between advanced glycosylation end-products (AGE) and a receptor (specifically RAGE). They are used to treat diseases associated with AGE/RAGE interaction, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New soluble advanced glycosylation end-product receptor polypeptide - used for reducing vascular permeability, complications of diabetes etc., also for purification and to screen for modulators

RAGE polypeptides AAY52132-Y52135 are used in the invention in a method for inhibiting tumour invasion and metastasis. The method involves inhibiting tumour invasion and metastasis via administration of a therapeutically effective amount of the pharmaceutical composition containing a RAGE polypeptide. The invention also relates to a method for evaluating the ability of an agent to inhibit tumour invasion in a local cellular environment. RAGE can be administered to a patient in a pharmaceutically acceptable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   considering tumour invasion. In normal developing neurons RAGE colocalizes with amphoterin which is a matrix associated polypeptide. The expression of both RAGE and amphoterin decreases after birth, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of the human soluble Receptor Advanced Glycation Endproducts (RAGE). RAGE interacts with a rphysiologically and pathophysiologically relevant ligands when

The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, haemodialysis associated amyloidosis or atherosclerosis. The Ab can also be used for the isolation and purification of human RAGE polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       prevents receptor permeability,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Anti-advanced glycosylation end product polypeptide antibody prevents receptor binding and therefore reduces vascular permeability, useful to treat diabetes mellitus
         New soluble advanced glycosylation end-product receptor polypeptide - used for reducing vascular permeability, complications of diabete etc., also for purification and to screen for modulators
                                                                                                                                                                                                                                   WO9739121-A1

These RAGE polypeptides are also used, when immobilised, to purify AGE from a protein mixture and to screen for compounds that are agonists and antagonists of ACE/RACE interaction. They can also be used diagnostically to detect abnormal levels of AGE. Antibodies against RAGE polypeptides are useful as immunoassay reagents for measurement of RACE levels, and as inhibitors of interaction between AGE and RAGE or other receptors and for purification and quantification of RAGE polypeptides. The encoding nucleic acids are used to express recombinant RAGE and as probes for isolating related
                                                                                     Material for extracorporeal circulation, applicable in selective elimination of diabetic complication factors such as carbonyl stress products caused by abnormally promoted carbonyl stress from excretory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           active fragments or their mimetics, inhibit interaction between advanced glycosylation end-products (AGE) and a receptor (specifically RAGE). The are used to treat diseases associated with AGE/RAGE interaction, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is a human advanced glycosylation end-product receptor (RAGE) polypeptide (340 amino acid residues). The RAGE polypeptides and i active fragments or their mimetics, inhibit interaction between ad

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0
```

The present invention describes a material for extracorporeal which is made from a water-insoluble carrier immobilized with

circulation a protein

```
CC amino acid sequence corresponding to an amino acid sequence of a CC V-domain of a receptor for an advanced glycation end product (RAGE). CC Also described are methods for: (1) inhibiting an amyloid-beta peptide CC (ABP) interaction with a receptor for RAGE when the receptor is on the Surface of a cell; (2) inhibiting degeneration of a neuronal cell; (3) cC inhibiting formation of an ABP fibril on a cell; (4) inhibiting CC extracellular assembly of an ABP into a fibril; (5) inhibiting infiltration of a microglial cell into senile plaques; (7) inhibiting activation of a microglial cell into senile plaques; (7) inhibiting activation of a ssociated with an interaction of an ABP with a receptor for RAGE on a CC cell; (9) evaluating the ability of an agent to inhibit binding of an CC inhibiting activation of a receptor for RAGE on the surface of a cell; (10) inhibiting activation of a RAF with a v-domain of a receptor for RAGE on the surface of a cell; (10) inhibiting activation of a RAF with a v-domain of a receptor for RAGE on the surface of a cell; (10) inhibiting activation of a NF-kappaB gene in a cell; (11) inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δõ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        having the sequence shown here. The materials of the invention, including adsorbents, are for extracorporeal circulation, which are applicable in the selective elimination of diabetic complication factors from a body fluid, and are therefore useful in treating vascular lesions like arteriosclerosis due to carbonyl stress products caused by abnormally promoted carbonyl stress from excretory dysfunction.
                                                                                                                                                                                                                                                                                                                          Claim
                                                                                                                                                                                                                                                                                                                                                           New peptides based on an advanced glycation end product receptor are useful for treating Alzheimer's disease and Down's syndrome

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
